Blind Finance Test Set — Evaluation Report

New batch: 50 cases across 10 ZIP files · compared with the private answer key

Executive summary

Matched 50 of 50 expected case IDs across the uploaded result workbooks. Strict accuracy is **96.00%** (48/50); decisive-only accuracy is **100.00%** across 48 Approved/Disapproved outputs. There are 2 Undefined outputs and 0 missing predictions. Missing and Undefined outputs count as not correct for strict accuracy.

Metric	Result	Meaning
Strict accuracy	96.00%	48/50; missing/unresolved not correct
Decisive-only accuracy	100.00%	48 decisive predictions
Predictions matched	50/50	0 missing
Undefined	2	Needs review
False positives	0	Disapproved predicted Approved
False negatives	0	Approved predicted Disapproved

Class-wise metrics

Class	TP	FP	FN	TN	Precision	Recall	F1	F2
Approved	23	0	2	25	1.000	0.920	0.958	0.935
Disapproved	25	0	0	25	1.000	1.000	1.000	1.000
Macro avg							0.979	0.967

TP = correct class prediction; FP = another actual class predicted as this class; FN = actual class predicted as the other class or Undefined; TN = all other cases. F1 is the harmonic mean of precision and recall. F2 weights recall more heavily (β=2). Missing cases count against strict accuracy and are excluded from class-level metrics.

ZIP-wise results

Test ZIP	N	Got	Missing	Correct	Strict acc.	Decisive acc.	Undef.	FP	FN

Confusion matrix (all expected cases)

Actual / predicted	Approved	Disapproved	Undefined	Missing
Approved	23	0	2	0
Disapproved	0	25	0	0

Case-by-case comparison

All 50 cases are listed. Missing means no matching CASE-### identifier was found in the uploaded result workbooks.

Quality note: 20 duplicate prediction rows with repeated case IDs were found across uploaded workbooks. Duplicate IDs are preserved in the Excel sheet for audit; for the main score, the last uploaded prediction for a case ID was used. Verify any duplicates before relying on the score. A 50-case set is a regression check, not proof of production reliability.
